

# Class 1: Abstracts and Data Access

CSCI6410/EPAH6410/CSCI4148

Finlay Maguire (finlay.maguire@dal.ca)

# Components of a written research proposal

- **Research Question:** *clearly defined research question related to solving an important problem*
- **Abstract:** *concise & informative expert overview*
- **Lay Summary:** *clear general public summary of problem, solution, and relevance*
- **Introduction:** *problem/knowledge gap justification/explanation of relevant methods*
- **Literature Review:** *critical appraisal of broad relevant literature that supports method and question*
- **Methodology:** *appropriate method, data gathering/access, that solves the research question and is justified by literature review*
- **Budget:** *reasonable/appropriate timeline and cost estimates*
- **Ethics:** *explores hurdles/risks/benefits and impact of question, method and KT*
- **Discussion:** *addresses limitations, implications, and future directions/extensions.*
- **Knowledge Translation:** *robust/impactful plan to mobile results across a range of settings.*

# Proposal Presentation Structure (June 12th)

## 15 minutes + 5 minutes Q&A

- Title Slide (1)
- Team Background and Conflicts of Interest (1)
- Background/Literature Review (3)
- Research Objectives/Question/Hypothesis (1)
- Methodology (3)
- Budgeting (1)
- Knowledge Translation Plan (1)
- Future Work (1)
- Q&A
  
- ***Chance for feedback -> incorporate into final submission***

# Abstract

“Several studies have reported reprogramming of fibroblasts into induced cardiomyocytes; however, reprogramming into proliferative induced cardiac progenitor cells (iCPCs) remains to be accomplished. Here we report that a combination of 11 or 5 cardiac factors along with canonical Wnt and JAK/STAT signaling reprogrammed adult mouse cardiac, lung, and tail tip fibroblasts into iCPCs. The iCPCs were cardiac mesoderm-restricted progenitors that could be expanded extensively while maintaining multipotency to differentiate into cardiomyocytes, smooth muscle cells, and endothelial cells in vitro. Moreover, iCPCs injected into the cardiac crescent of mouse embryos differentiated into cardiomyocytes. iCPCs transplanted into the post-myocardial infarction mouse heart improved survival and differentiated into cardiomyocytes, smooth muscle cells, and endothelial cells. Lineage reprogramming of adult somatic cells into iCPCs provides a scalable cell source for drug discovery, disease modeling, and cardiac regenerative therapy.” (p. 354)

The first sentence announces the **topic** under study, summarizes what’s **already known** or been accomplished in **previous research**, and signals the **rationale and goals are for the new research and the problem** that the new research solves: How can researchers reprogram fibroblasts into iCPCs?

The **methods** the researchers developed to achieve their goal and a description of the **results**.

The **significance or implications**—for drug discovery, disease modeling, and therapy—of this reprogramming of adult somatic cells into iCPCs.

## Ten Quick Tips for Deep Learning in Biology

# Lay Summary

## *How to write a Lay Summary for your website*

Parents of autistic children in Europe have positive attitudes towards research involving babies who might be autistic.

We asked 1040 parents who have a child on the autism spectrum about their attitudes to research. Specifically we asked them about research with babies who don't yet have a diagnosis of autism, but who are more likely to be autistic because they have an older, autistic brother or sister.

Parents with an autistic child are central to these studies, because they decide whether to get involved. It's important to find out their opinions on this work, so we can make it easy to take part, ethical, and useful.

In our sample, from 11 European countries, attitudes were positive overall, and parents valued the scientific goals of research. We also learned about what parents want when it comes to the types of research they would be happy to take part in.

The findings of this work can influence how researchers design their studies, and also provide an example of how to involve the community in research.

*Start by stating your main finding clearly. This is the key thing most people want to know about your study*

*Describe the method that underpinned that key finding, ideally in a single sentence*

*Now you can add a bit more methodological detail, to help readers understand more about what you did.*

*This is where I would describe why you were interested in this question. It comes in the middle – much later than a normal abstract*

*Repeat your main finding and add a bit more info. It is OK to leave out some of the detail, especially if you're worried about mis-representing what you found.*

*Finish by stating why your research is important and how it will contribute to changing things in the future.*

# Performing a Systematic Literature Review

# Performing a Systematic Literature Review

# Getting Access to Data: HDNS Example

- Health Data Nova Scotia: administrative and clinical health data for province
- Line-level access to de-identified data
- Data linkage services for external data (including probabilistically)
- Analyses: either done by HDNS or by yourself on their hadoop cluster (CITADEL)

# HDNS Holdings

- Insured Patient Registry (MASTER): demographics of everyone on MSI (1996-)
  - Licensed Provider Registry (DOCTORS): demographics of all health service providers (1995-)
  - Eligibility Group (EGROUP): MSI beneficiary information in long-term care (1995-)
  - Vital Statistics (VITAL): statcan's population/death information (1990-2019)
  - MSI Physician's Billings (MED): all billing information i.e., every encounter between an individual and a provider (1997-)
  - Drug Information System (DIS): every community prescription filled (2016-)
  - Senior's Pharmacare (PHARM): senior prescriptions (1989-)
- 
- CIHI Discharge Abstract Database (DAD): local part of national database recording everyone leaving hospital (1989/1995-)
  - CIHI National Ambulatory Care Reporting System (NACRS): local part of national database recording all ambulatory care

# A typical data access process

1. Contact database organisation to make sure you understand their holdings
2. Data access feasibility and cost estimate application (including research proposal)
3. Data access request application (including proposal, research ethics submission, CV) for committee review and feedback
4. Research Ethics Board approval process
5. Sign contracts (e.g., data access and confidentiality agreements) and complete related training.
6. If linking data: send your external dataset to database organisation
7. Perform your analysis (often with restrictions on where/how)
8. Submit any analysis results for review before releasing.
